Section 1 : Coding

1. Problem Statement

Saran is developing a simulation for a theme park where people wait in a queue for a popular ride.

Each person has a unique ticket number, and he needs to manage the queue using a linked list implementation.

Your task is to write a program for Saran that reads the number of people in the queue and their respective ticket numbers, enqueue them, and then calculate the sum of all ticket numbers to determine the total ticket value present in the queue.

Input Format

The first line of input consists of an integer N, representing the number of people

in the queue.

The second line consists of N space-separated integers, representing the ticket numbers.

Output Format

The output prints an integer representing the sum of all ticket numbers.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
2 4 6 7 5
Output: 24

Answer

```
#include <stdio.h>
#include <stdlib.h>

typedef struct Node {
    int data;
    struct Node* next;
} Node;

typedef struct Queue {
    Node* front;
    Node* rear;
} Queue;

void enqueue(Queue* q, int value) {
    Node* newNode = (Node*)malloc(sizeof(Node));
    newNode->data = value;
    newNode->next = NULL;
    if (q->rear == NULL) {
        q->front = q->rear = newNode;
    } else {
        q->rear->next = newNode;
        q->rear = newNode;
    }
```

```
}

int calculateSum(Queue* q) {
    int sum = 0;
    Node* temp = q->front;
    while (temp != NULL) {
        sum += temp->data;
        temp = temp->next;
    }
    return sum;
}

void freeQueue(Queue* q) {
    Node* temp;
    while (q->front != NULL) {
        temp = q->front;
        q->front = q->front->next;
        free(temp);
    }
    q->rear = NULL;
}

int main() {
    Queue q = {NULL, NULL};
    int n, value;

    scanf("%d", &n);

    if (n < 1 || n > 15) {
        printf("Invalid number of people in queue.\n");
        return 1;
    }

    for (int i = 0; i < n; i++) {
        scanf("%d", &value);
        enqueue(&q, value);
    }

    printf("%d\n", calculateSum(&q));

    freeQueue(&q);
```

```
    return 0;
}
```

Status : Correct ***Marks : 10/10***

2. Problem Statement

A customer support system is designed to handle incoming requests using a queue. Implement a linked list-based queue where each request is represented by an integer. After processing the requests, remove any duplicate requests to ensure that each request is unique and print the remaining requests.

Input Format

The first line of input consists of an integer N, representing the number of requests to be enqueued.

The second line consists of N space-separated integers, each representing a request.

Output Format

The output prints space-separated integers after removing the duplicate requests.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
2 4 2 7 5
Output: 2 4 7 5

Answer

```
#include <stdio.h>
#include <stdlib.h>

typedef struct Node {
    int data;
```

```
    struct Node* next;
} Node;

typedef struct Queue {
    Node* front;
    Node* rear;
} Queue;

void enqueue(Queue* q, int value) {
    Node* newNode = (Node*)malloc(sizeof(Node));
    newNode->data = value;
    newNode->next = NULL;
    if (q->rear == NULL) {
        q->front = q->rear = newNode;
    } else {
        q->rear->next = newNode;
        q->rear = newNode;
    }
}

void removeDuplicates(Queue* q) {
    Node *current = q->front, *prev = NULL;
    int seen[101] = {0};
    while (current != NULL) {
        if (seen[current->data]) {
            prev->next = current->next;
            free(current);
            current = prev->next;
        } else {
            seen[current->data] = 1;
            prev = current;
            current = current->next;
        }
    }
}

void displayQueue(Queue* q) {
    Node* temp = q->front;
    while (temp != NULL) {
        printf("%d ", temp->data);
        temp = temp->next;
    }
```

```
    printf("\n");
}

void freeQueue(Queue* q) {
    Node* temp;
    while (q->front != NULL) {
        temp = q->front;
        q->front = q->front->next;
        free(temp);
    }
    q->rear = NULL;
}

int main() {
    Queue q = {NULL, NULL};
    int n, value;

    scanf("%d", &n);

    if (n < 1 || n > 15) {
        printf("Invalid number of requests.\n");
        return 1;
    }

    for (int i = 0; i < n; i++) {
        scanf("%d", &value);
        enqueue(&q, value);
    }

    removeDuplicates(&q);
    displayQueue(&q);
    freeQueue(&q);

    return 0;
}
```

Status : Correct **Marks : 10/10**

3. Problem Statement

Fathima has been tasked with developing a program to manage a queue of

customers waiting in line at a service center. Help her write a program simulating a queue data structure using a linked list.

Here is a description of the scenario and the required operations:

Enqueue: Add a customer to the end of the queue.Dequeue: Remove and discard a customer from the front of the queue.Display waiting customers: Display the front and rear customer IDs in the queue.

Write a program that enqueues all the customers into the queue, performs a dequeue operation, and prints the front and rear elements.

Input Format

The first input line consists of an integer N, representing the number of customers to be inserted into the queue.

The second line consists of N space-separated integers, representing the customer IDs.

Output Format

The output prints "Front: X, Rear: Y" where X is the front element and Y is the rear element, after performing the dequeue operation.

Refer to the sample output for the exact text and format.

Sample Test Case

Input: 5
112 104 107 116 109

Output: Front: 104, Rear: 109

Answer

```
#include <stdio.h>
#include <stdlib.h>

typedef struct Node {
    int data;
    struct Node* next;
} Node;
```

```
typedef struct Queue {
    Node* front;
    Node* rear;
} Queue;

void enqueue(Queue* q, int value) {
    Node* newNode = (Node*)malloc(sizeof(Node));
    newNode->data = value;
    newNode->next = NULL;
    if (q->rear == NULL) {
        q->front = q->rear = newNode;
    } else {
        q->rear->next = newNode;
        q->rear = newNode;
    }
}

void dequeue(Queue* q) {
    if (q->front == NULL) {
        return;
    }

    Node* temp = q->front;
    q->front = q->front->next;
    free(temp);

    if (q->front == NULL) {
        q->rear = NULL;
    }
}

void displayFrontRear(Queue* q) {
    if (q->front == NULL) {
        printf("Queue is empty\n");
        return;
    }
    printf("Front: %d, Rear: %d\n", q->front->data, q->rear->data);
}

void freeQueue(Queue* q) {
    Node* temp;
```

```
    while (q->front != NULL) {
        temp = q->front;
        q->front = q->front->next;
        free(temp);
    }
    q->rear = NULL;
}

int main() {
    Queue q = {NULL, NULL};
    int n, value;

    scanf("%d", &n);

    if (n < 2 || n > 20) {
        printf("Invalid number of customers.\n");
        return 1;
    }

    for (int i = 0; i < n; i++) {
        scanf("%d", &value);
        enqueue(&q, value);
    }

    dequeue(&q);
    displayFrontRear(&q);
    freeQueue(&q);

    return 0;
}
```

Section 1 : Coding

1. Problem Statement

You are tasked with developing a simple ticket management system for a customer support department. In this system, customers submit support tickets, which are processed in a First-In-First-Out (FIFO) order. The system needs to handle the following operations:

Ticket Submission (Enqueue Operation): New tickets are submitted by customers. Each ticket is assigned a unique identifier (represented by an integer). When a new ticket arrives, it should be added to the end of the queue.

Ticket Processing (Dequeue Operation): The support team processes tickets in the order they are received. The ticket at the front of the queue is processed first. After processing, the ticket is removed from the queue.

Display Ticket Queue: The system should be able to display the current state of the ticket queue, showing the sequence of ticket identifiers from front to rear.

Input Format

The first input line contains an integer n, the number of tickets submitted by customers.

The second line consists of a single integer, representing the unique identifier of each submitted ticket, separated by a space.

Output Format

The first line displays the "Queue: " followed by the ticket identifiers in the queue after all tickets have been submitted.

The second line displays the "Queue After Dequeue: " followed by the ticket identifiers in the queue after processing (removing) the ticket at the front.

Refer to the sample output for the exact text and format.

Sample Test Case

Input: 6
14 52 63 95 68 49
Output: Queue: 14 52 63 95 68 49
Queue After Dequeue: 52 63 95 68 49

Answer

```
#include <stdio.h>
#define MAX_SIZE 20

void displayQueue(int queue[], int size) {
    printf("Queue: ");
    for (int i = 0; i < size; i++) {
        printf("%d ", queue[i]);
    }
    printf("\n");
}
```

```
void dequeueAndDisplay(int queue[], int size) {
    printf("Queue After Dequeue: ");
    for (int i = 1; i < size; i++) {
        printf("%d ", queue[i]);
    }
    printf("\n");
}

int main() {
    int n;
    scanf("%d", &n);

    if (n < 2 || n > MAX_SIZE) {
        printf("Invalid number of tickets.\n");
        return 1;
    }

    int queue[MAX_SIZE];

    for (int i = 0; i < n; i++) {
        scanf("%d", &queue[i]);
    }

    displayQueue(queue, n);
    dequeueAndDisplay(queue, n);

    return 0;
```

Status : Wrong **Marks : 0/10**

2. Problem Statement

You've been assigned the challenge of developing a queue data structure using a linked list.

The program should allow users to interact with the queue by enqueuing positive integers and subsequently dequeuing and displaying elements.

Input Format

The input consists of a series of integers, one per line. Enter positive integers into the queue.

Enter -1 to terminate input.

Output Format

The output prints the space-separated dequeued elements.

Refer to the sample output for the exact text and format.

Sample Test Case

Input: 1
2
3
4
-1
Output: Dequeued elements: 1 2 3 4

Answer

```
#include <stdio.h>
#include <stdlib.h>

typedef struct Node {
    int data;
    struct Node* next;
} Node;

typedef struct Queue {
    Node* front;
    Node* rear;
} Queue;

void enqueue(Queue* q, int value) {
    Node* newNode = (Node*)malloc(sizeof(Node));
    newNode->data = value;
    newNode->next = NULL;
    if (q->rear == NULL) {
        q->front = q->rear = newNode;
    } else {
```

```
        q->rear->next = newNode;
        q->rear = newNode;
    }
}

void dequeueAndDisplay(Queue* q) {
    printf("Dequeued elements: ");
    while (q->front != NULL) {
        Node* temp = q->front;
        printf("%d ", temp->data);
        q->front = q->front->next;
        free(temp);
    }
    printf("\n");
    q->rear = NULL;
}

int main() {
    Queue q = {NULL, NULL};
    int value;

    while (1) {
        scanf("%d", &value);
        if (value == -1) {
            break;
        }
        enqueue(&q, value);
    }

    dequeueAndDisplay(&q);

    return 0;
}
```

Status : Correct **Marks : 10/10**

3. Problem Statement

Amar is working on a project where he needs to implement a special type of queue that allows selective dequeuing based on a given multiple. He wants to efficiently manage a queue of integers such that only elements

not divisible by a given multiple are retained in the queue after a selective dequeue operation.

Implement a program to assist Amar in managing his selective queue.

Example

Input:

5

10 2 30 4 50

5

Output:

Original Queue: 10 2 30 4 50

Queue after selective dequeue: 2 4

Explanation:

After selective dequeue with a multiple of 5, the elements that are multiples of 5 should be removed. Therefore, only 10, 30, and 50 should be removed from the queue. The updated Queue is 2 4.

Input Format

The first line contains an integer n, representing the number of elements initially present in the queue.

The second line contains n space-separated integers, representing the elements of the queue.

The third line contains an integer multiple, representing the divisor for selective dequeue operation.

Output Format

The first line of output prints "Original Queue: " followed by the space-separated elements in the queue before the dequeue operation.

The second line prints "Queue after selective dequeue: " followed by the remaining space-separated elements in the queue, after deleting elements that are the multiples of the specified number.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 5
10 2 30 4 50
5
Output: Original Queue: 10 2 30 4 50
Queue after selective dequeue: 2 4

Answer

```
#include <stdio.h>

#define MAX_SIZE 50

void displayQueue(int queue[], int size) {
    printf("Original Queue: ");
    for (int i = 0; i < size; i++) {
        printf("%d ", queue[i]);
    }
    printf("\n");
}

void selectiveDequeue(int queue[], int size, int multiple) {
    printf("Queue after selective dequeue: ");
    for (int i = 0; i < size; i++) {
        if (queue[i] % multiple != 0) {
            printf("%d ", queue[i]);
        }
    }
    printf("\n");
}

int main() {
    int n, multiple;
    scanf("%d", &n);

    if (n < 1 || n > MAX_SIZE) {
        printf("Invalid number of elements.\n");
```

```
    return 1;
}

int queue[MAX_SIZE];

for (int i = 0; i < n; i++) {
    scanf("%d", &queue[i]);
}

scanf("%d", &multiple);

displayQueue(queue, n);
selectiveDequeue(queue, n, multiple);

return 0;
}
```

Status : Correct **Marks : 10/10**

4. Problem Statement

Sharon is developing a queue using an array. She wants to provide the functionality to find the Kth largest element. The queue should support the addition and retrieval of the Kth largest element effectively. The maximum capacity of the queue is 10.

Assist her in the program.

Input Format

The first line of input consists of an integer N, representing the number of elements in the queue.

The second line consists of N space-separated integers.

The third line consists of an integer K.

Output Format

For each enqueued element, print a message: "Enqueued: " followed by the element.

The last line prints "The [K]th largest element: " followed by the Kth largest element.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
23 45 93 87 25
4

Output: Enqueued: 23
Enqueued: 45
Enqueued: 93
Enqueued: 87
Enqueued: 25
The 4th largest element: 25

Answer

```
#include <stdio.h>

#define MAX_SIZE 10

void enqueueAndDisplay(int queue[], int size) {
    for (int i = 0; i < size; i++) {
        printf("Enqueued: %d\n", queue[i]);
    }
}

void findKthLargest(int queue[], int size, int k) {
    // Sorting the queue in descending order
    for (int i = 0; i < size - 1; i++) {
        for (int j = i + 1; j < size; j++) {
            if (queue[i] < queue[j]) {
                int temp = queue[i];
                queue[i] = queue[j];
                queue[j] = temp;
            }
        }
    }
```

```
    printf("The %dth largest element: %d\n", k, queue[k - 1]);
}

int main() {
    int n, k;
    scanf("%d", &n);

    if (n < 1 || n > MAX_SIZE) {
        printf("Invalid number of elements.\n");
        return 1;
    }

    int queue[MAX_SIZE];

    for (int i = 0; i < n; i++) {
        scanf("%d", &queue[i]);
    }

    scanf("%d", &k);

    enqueueAndDisplay(queue, n);
    findKthLargest(queue, n, k);

    return 0;
}
```

Status : Correct ***Marks : 10/10***

5. Problem Statement

Guide Harish in developing a simple queue system for a customer service center. The customer service center can handle up to 25 customers at a time. The queue needs to support basic operations such as adding a customer to the queue, serving a customer (removing them from the queue), and displaying the current queue of customers.

Use an array for implementation.

Input Format

The first line of the input consists of an integer N, the number of customers

arriving at the service center.

The second line consists of N space-separated integers, representing the customer IDs in the order they arrive.

Output Format

After serving the first customer in the queue, display the remaining customers in the queue.

If a dequeue operation is attempted on an empty queue, display "Underflow".

If the queue is empty, display "Queue is empty".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
101 102 103 104 105
Output: 102 103 104 105

Answer

```
#include <stdio.h>

#define MAX_SIZE 25

void displayQueue(int queue[], int size) {
    if (size == 0) {
        printf("Queue is empty\n");
        return;
    }

    for (int i = 0; i < size; i++) {
        printf("%d ", queue[i]);
    }
    printf("\n");
}

void dequeue(int queue[], int *size) {
    if (*size == 0) {
```

```
        printf("Underflow\nQueue is empty\n");
        return;
    }

    // Shift elements to the left to remove the front
    for (int i = 1; i < *size; i++) {
        queue[i - 1] = queue[i];
    }
    (*size)--;

    displayQueue(queue, *size);
}

int main() {
    int n;
    scanf("%d", &n);

    if (n < 0 || n > MAX_SIZE) {
        printf("Invalid number of customers.\n");
        return 1;
    }

    int queue[MAX_SIZE];

    for (int i = 0; i < n; i++) {
        scanf("%d", &queue[i]);
    }

    dequeue(queue, &n);

    return 0;
}
```

Section 1 : Coding

1. Problem Statement

You are tasked with implementing basic operations on a queue data structure using a linked list.

You need to write a program that performs the following operations on a queue:

Enqueue Operation: Implement a function that inserts an integer element at the rear end of the queue.Print Front and Rear: Implement a function that prints the front and rear elements of the queue. Dequeue Operation: Implement a function that removes the front element from the queue.

Input Format

The first line of input consists of an integer N, representing the number of elements to be inserted into the queue.

The second line consists of N space-separated integers, representing the queue elements.

Output Format

The first line prints "Front: X, Rear: Y" where X is the front and Y is the rear elements of the queue.

The second line prints the message indicating that the dequeue operation (front element removed) is performed: "Performing Dequeue Operation:".

The last line prints "Front: M, Rear: N" where M is the front and N is the rear elements after the dequeue operation.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 5
12 56 87 23 45

Output: Front: 12, Rear: 45
Performing Dequeue Operation:
Front: 56, Rear: 45

Answer

```
#include <stdio.h>
#include <stdlib.h>

struct Node {
    int data;
    struct Node* next;
};

struct Node* front = NULL;
struct Node* rear = NULL;

void enqueue(int d) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    if (!newNode) {
        printf("Memory allocation failed\n");
```

```
        return;
    }
    newNode->data = d;
    newNode->next = NULL;

    if (rear == NULL) {
        front = rear = newNode;
    } else {
        rear->next = newNode;
        rear = newNode;
    }
}

void printFrontRear() {
    if (front == NULL) {
        printf("Queue is empty.\n");
        return;
    }
    printf("Front: %d, Rear: %d\n", front->data, rear->data);
}

void dequeue() {
    if (front == NULL) {
        printf("Queue is empty. Nothing to dequeue.\n");
        return;
    }

    struct Node* temp = front;
    front = front->next;
    free(temp);

    if (front == NULL) {
        rear = NULL; // If queue becomes empty after dequeuing
    }
}

int main() {
    int n, data;
    scanf("%d", &n);
    for (int i = 0; i < n; i++) {
        scanf("%d", &data);
        enqueue(data);
    }
```

```
    printFrontRear();
    printf("Performing Dequeue Operation:\n");
    dequeue();
    printFrontRear();
    return 0;
}
```

Marks Obtained : 5

Section 1 : Coding

1. Problem Statement

In an office setting, a print job management system is used to efficiently handle and process print jobs. The system is implemented using a queue data structure with an array.

The program provides the following operations:

Enqueue Print Job: Add a print job with a specified number of pages to the end of the queue.Dequeue Print Job: Remove and process the next print job in the queue.Display Queue: Display the print jobs in the queue

The program should ensure that print jobs are processed in the order they are received.

Input Format

The input consists of integers corresponding to the operation that needs to be performed:

Choice 1: Enqueue the print job into the queue. If the choice is 1, the following input is a space-separated integer, representing the pages to be enqueued into the queue.

Choice 2: Dequeue a print job from the queue.

Choice 3: Display the print jobs in the queue.

Choice 4: Exit the program.

Output Format

The output displays messages according to the choice and the status of the queue:

If the choice is 1:

1. Insert the given page into the queue and display "Print job with [page] pages is enqueued." where [page] is the number of pages that are inserted.
2. If the queue is full, print "Queue is full. Cannot enqueue."

If the choice is 2:

1. Dequeue a page from the queue and display "Processing print job: [page] pages" where [page] is the corresponding page that is dequeued.
2. If the queue is empty without any elements, print "Queue is empty."

If the choice is 3:

1. The output prints "Print jobs in the queue: " followed by the space-separated pages present in the queue.
2. If there are no elements in the queue, print "Queue is empty."

If the choice is 4:

1. Exit the program and print "Exiting program"

If any other choice is entered, the output prints "Invalid option."

Refer to the sample output for the formatting specifications.

Section 1 : Coding

1. Problem Statement

Write a program to implement a queue using an array and pointers. The program should provide the following functionalities:

Insert an element into the queue.Delete an element from the queue.Display the elements in the queue.

The queue has a maximum capacity of 5 elements. If the queue is full and an insertion is attempted, a "Queue is full" message should be displayed. If the queue is empty and a deletion is attempted, a "Queue is empty" message should be displayed.

Input Format

Each line contains an integer representing the chosen option from 1 to 3.

Option 1: Insert an element into the queue followed by an integer representing the element to be inserted, separated by a space.

Option 2: Delete an element from the queue.

Option 3: Display the elements in the queue.

Output Format

For option 1 (insertion):-

1. The program outputs: "<data> is inserted in the queue." if the data is successfully inserted.
2. "Queue is full." if the queue is already full and cannot accept more elements.

For option 2 (deletion):-

1. The program outputs: "Deleted number is: <data>" if an element is successfully deleted and returns the value of the deleted element.
2. "Queue is empty." if the queue is empty no elements can be deleted.

For option 3 (display):-

1. The program outputs: "Elements in the queue are: <element1> <element2> ... <elementN>" where <element1>, <element2>, ..., <elementN> represent the elements present in the queue.
2. "Queue is empty." if the queue is empty no elements can be displayed.

For invalid options, the program outputs: "Invalid option."

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 1 10

3
5
Output: 10 is inserted in the queue.
Elements in the queue are: 10
Invalid option.

Answer

```
#include <stdio.h>
#include <stdlib.h>

#define max 5

int queue[max];
int front = -1, rear = -1;

int insertq(int *data) {
   if (rear == max - 1) {
      return 0;
   }
   if (front == -1) {
      front = 0;
   }
   queue[++rear] = *data;
   return 1;
}

int delq() {
   if (front == -1 || front > rear) {
      printf("Queue is empty.\n");
      return 0;
   }
   printf("Deleted number is: %d\n", queue[front]);
   front++;
   return 1;
}

void display() {
   if (front == -1 || front > rear) {
      printf("Queue is empty.\n");
      return;
   }
   printf("Elements in the queue are:");
```

```
    for (int i = front; i <= rear; i++) {
        printf(" %d", queue[i]);
    }
    printf("\n");
}

int main()
{
    int data, reply, option;
    while (1)
    {
        if (scanf("%d", &option) != 1)
            break;
        switch (option)
        {
            case 1:
                if (scanf("%d", &data) != 1)
                    break;
                reply = insertq(&data);
                if (reply == 0)
                    printf("Queue is full.\n");
                else
                    printf("%d is inserted in the queue.\n", data);
                break;
            case 2:
                delq();  //    Called without arguments
                break;
            case 3:
                display();
                break;

Section 1 : Coding

1. Problem Statement

Imagine a bustling coffee shop, where customers are placing their orders for their favorite coffee drinks. The cafe owner Sheeren wants to efficiently manage the queue of coffee orders using a digital system. She needs a program to handle this queue of orders.

You are tasked with creating a program that implements a queue for coffee orders. Each character in the queue represents a customer's coffee order, with 'L' indicating a latte, 'E' indicating an espresso, 'M' indicating a macchiato, 'O' indicating an iced coffee, and 'N' indicating a nabob.

Customers can place orders and enjoy their delicious coffee drinks.

Input Format

The input consists of integers corresponding to the operation that needs to be performed:

Choice 1: Enqueue the coffee order into the queue. If the choice is 1, the following input is a space-separated character ('L', 'E', 'M', 'O', 'N').

Choice 2: Dequeue a coffee order from the queue.

Choice 3: Display the orders in the queue.

Choice 4: Exit the program.

Output Format

The output displays messages according to the choice and the status of the queue:

If the choice is 1:

1. Insert the given order into the queue and display "Order for [order] is enqueued." where [order] is the coffee order that is inserted.
2. If the queue is full, print "Queue is full. Cannot enqueue more orders."

If the choice is 2:

1. Dequeue a character from the queue and display "Dequeued Order: " followed by the corresponding order that is dequeued.
2. If the queue is empty without any orders, print "No orders in the queue."

If the choice is 3:

1. The output prints "Orders in the queue are: " followed by the space-separated orders present in the queue.
2. If there are no orders in the queue, print "Queue is empty. No orders available."

If the choice is 4:

1. Exit the program and print "Exiting program"

If any other choice is entered, the output prints "Invalid option."

Refer to the sample output for the exact text and format.

Sample Test Case

Input: 1 L
1 E
1 M
1 O
1 N
1 O
3
2
3
4

Output: Order for L is enqueued.
Order for E is enqueued.
Order for M is enqueued.
Order for O is enqueued.
Order for N is enqueued.
Queue is full. Cannot enqueue more orders.
Orders in the queue are: L E M O N
Dequeued Order: L
Orders in the queue are: E M O N
